

Neighbor Rental-Ready

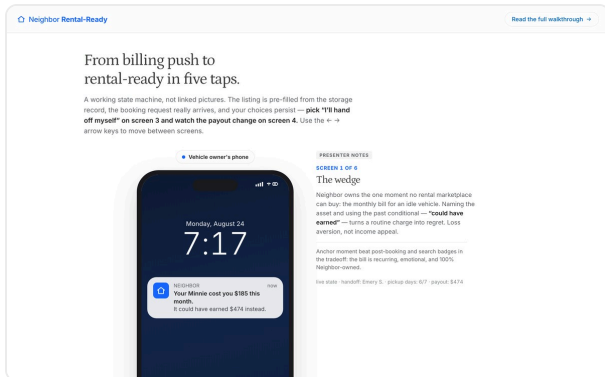

Turning Neighbor into the rental depot for the vehicles already stored on it — so a storage bill can be cancelled by the RV sitting on the lot. **Everything is live at the three links below; each preview is clickable.**

1 The walkthrough

The full argument, in the order I would present it: the thesis and the three advantages, the journey map across all three actors, the prototype, unit economics and rollout, risks, and a talk track. **Start here.**

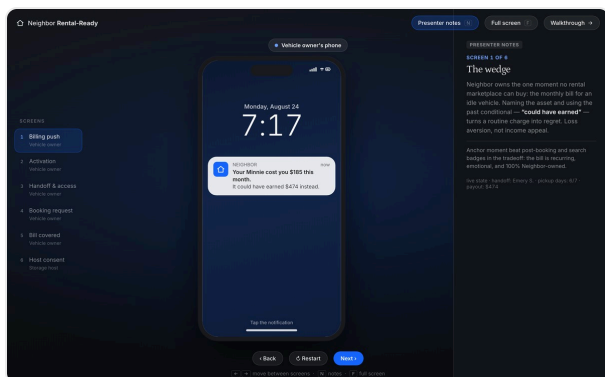

tyler-aston.github.io/rental-ready/

2 The experience

Just the clickable prototype, with a short intro around it. Six screens from a storage billing push to a booked RV — the listing is pre-filled from the storage record and your choices carry through.

tyler-aston.github.io/rental-ready/prototype.html

3 The live demo

The same prototype full screen, with nothing around it: a screen rail, presenter notes, and the device scaled to fill the display. **Best for screen-sharing.**
